

cover (plants are not glaucous) as well as by fewer flowers in heads and not very inflated sheaths of upper leaves. *D. capitatus* (described from the seeds of unknown origin: "Semina recepi a cl. Babisio sub nomine *D. capitati*") is distributed in SE Europe, the Mediterranean area, W. Turkey as well as in Ciscaucasia, in the Great Caucasus, NW and W Transcaucasia, whereas *D. subulosus* occurs in SW, C, E and S Transcaucasia. Nevertheless, the relationship between *D. capitatus* and *D. subulosus* needs further investigating.

The specimens from the Upper Akhurian floristic region have thinner and narrower bracts not completely enveloping the head. Probably it is a consequence of hybridization between *D. subulosus* and *D. calocephalus*.

The specimen from vicinities of Lake Sevan in Armenia ("Goktschay, Armenia, 04.07.[18]71, G. Radde, No. 342", LE!) mentioned by M. Kuzmina (2003) as *D. carmelitarum* Reut. ex Boiss. proved to be *D. subulosus*. *D. carmelitarum* was described from NE Anatolia (holo.: "Tech-dagh, Jul. 1853, A Huet du Pavillon", G-BOIS!). Its area of distribution spreads through Erzurum vilayet and the regions of N and NE Turkey along the Black Sea coast, including those adjacent to SW Transcaucasia [vilayets ?Bursa, Sinop, Ordu, Giresun, Guemueshane, Rize, Trabzon, Choruh (Artwin)]. The species has coriaceous epicalyx scales tapered into herbaceous apex and obconic flower heads.

The Caucasus (the eastern part of the Great Caucasus mountain range, E, W, SW and S Transcauc.), NE Anatolia (Kars).

Described from Armenia. Holo.: "Armenia, Pylae Gösöldara, 2/7 [18]71, No. 381, G. Radde", LE!, iso. TBI!

5. ***D. caucaseus*** Sims, 1804 in Curtis's Bot. Mag. (London), 20: tab. 795; Grossh. 1930, Фл. Кавк. 2: 432; Gvinian. 1972, Not. Syst. Geogr. Tbilisi. 29: 33; id. 1978, Фл. Груз. 4: 189; M. Kuzmina, 2002, Komarova, 2: 38. — *D. discolor* Sims, 1809 in Curtis's Bot. Mag. (London), 29: tab. 1162; Schischk. 1936, Фл. СССР, 6: 825; Grossh. 1945, Фл. Кавк. ed. 2, 3: 285; id., 1949, Опред. раст. Кавк.: 559; Schischk., E. Avet. 1956, Фл. Арм. 2: 201; Karjagin, 1952, Фл. Азерб. 3: 375. — *D. montanus* auct. non F.W.Schmidt: M. Bieb. 1808, Fl. Taur.-Cauc. 1: 328. — *D. seguieri* auct. non Vill.: Reeve, 1967, Fl. Turk. 2: 122.

Edges of forests, subalpine meadows, stony slopes, 1200—2600 m a. s. l. Fl. VII—VIII. Fr. VIII—IX. — Armenia: Lori., Ijev., Sevan., Apar., Dar. (Vayotsdzor mountain pass).

The Caucasus (except Talysh), NE Anatolia (vilayet Kars: Grossheim, 1945: map 327).

Described by plants grown from seeds originating from the Caucasus ("native of Mount Caucasus"). **Lectotypus (hic designatus)**: tab. 795 in Curtis's Bot. Mag. (London), 1804, 20.

The illustration of *D. caucaseus* in the protologous differs from the typical representatives of the Caucasian species by shortened sterile shoots and deeply incised petals having the same coloration on the both surfaces. Nevertheless, as far as I know, species with such a set of features does not exist in the Caucasus. The drawing might have been made from an atypical specimen, and the under surface of the petals

was coloured pinkish instead of greenish-yellow by mistake. Therefore it seems necessary to me that at this stage of research *D. discolor*, whose drawing in the protologous bears formal resemblance to Caucasian species, should remain as a synonym of *D. caucaseus*.

*D. discolor* is described from the Caucasus ("native of Mount Caucasus"). **Lectotypus (hic designatus)**: tab. 1162 in Curtis's Bot. Mag. (London), 1809, 29.

### 6. *Dianthus gabrielianae* Nersesian, sp. nov.

Planta perennis. Caules floriferi 20—25(30) cm alti, 2—6-flori, glabri vel sparse puberuli, in tertia parte superiore laxe ramosi, incrassato-nodosi. Folia anguste lanceolato-linearia vel fere linearia, apicem versus longe attenuata, acuminata, 25—40×1.5—2 (—2.5) mm, plana vel marginibus leviter involuta, nervo mediano prominente, margine breviter ciliata, vaginis 1.5—2 mm longis. Calyculus 4 (—6)-bracteatus; bractae exteriore dimidiae calycis longitudinis vel basin dentium attingentes, ovatae vel anguste ovatae, in cuspidem subulatam, setulosam, 5—9 mm longam sensim angustatae; interiores 1/2—3/4 calycis longitudinis attingentes, late ovatae, in cuspidem subulatam vel aristam 3—4 mm longam abrupte attenuatae, late membranaceo-marginatae. Calyx 14—17×4—5 mm, cylindricus, viridis vel purpurascens; dentes 4—6 mm longi, late triangulares, acuminati, margine ciliati. Petalorum lamina obovata, 7—10×5—7 mm, supra saturate rosea vel purpurea atropunctata, subtus flavo-virentia, barbulata, dentata; unguis e calyce aliquanto exsertus.

**Holotypus**: Армения, Амасийский район, оз. Арпи, Пеликаный остров, 17.07.1991, Э. Габриэлян, ERE 146671 (fig. 1).

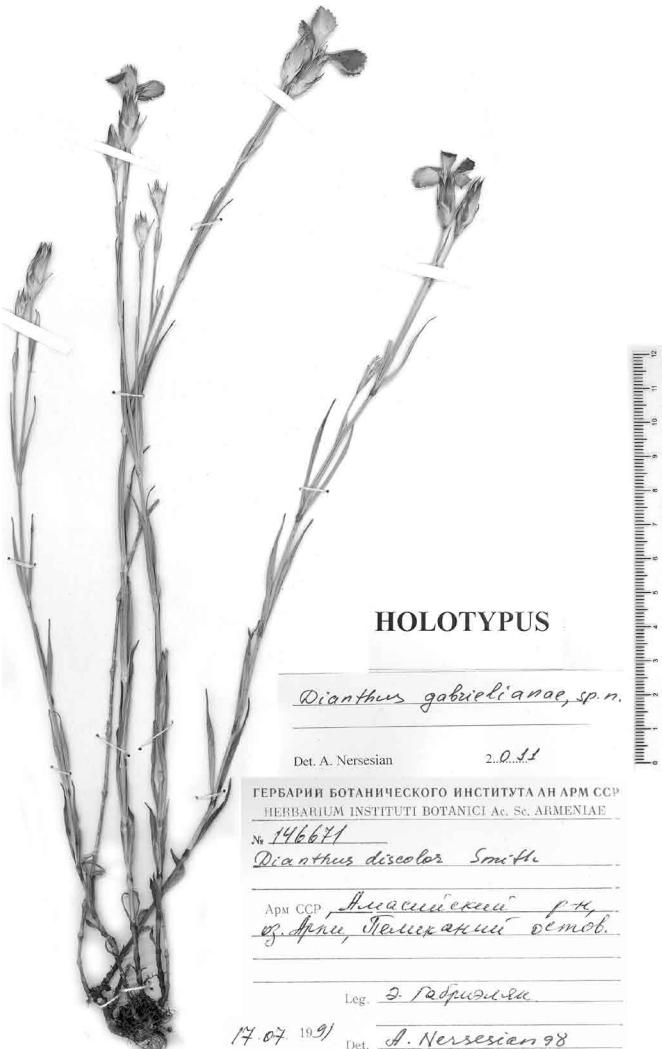

Fig. 1. Holotype of *Dianthus gabrielianae* Nersesian

Paratypi: Georgia: Prov. Tiflis, dist. Achalkalaki (Dzhevakheta), prope pagum Gorelovka, 1750 m, 31.07.1924, A. Grossheim, TBI; Джавахети. Выше с. Хавети. Субальпийский луг. 15.07.1983, Л. Назарова, ERE 151531

Habitatio: In pratis subalpinis, 1750—2100 m supra maris aequor.

Distributio: In Transcaucasia austro-occidentali (Georgia, Armenia) endemica.

Affinitas: A simili *D. caucaseo* Sims foliis fere linearibus, apicem versus longe attenuatis, bracteis exterioribus non foliaceis, calycibus brevioribus differt.

Species in honorem professoris Eleonorae Gabrielianae florae Armeniae peritissimae denominata est.

Perennial. Flowering shoots 20—25(30) cm tall, glabrous or sparsely puberulent, 2—6-flowered, loosely branched in the upper 1/3; nodes inflated. Leaves narrowly lanceolate-linear, almost linear, long tapered towards apex, acuminate, 25—40×1.5—2 (—2.5) mm, flat or margins slightly involuted; central vein prominent; margins shortly ciliate; sheaths 1.5—2 mm long. Epicalyx scales 4 (6); outer ones 1/2 as long as calyx or reaching the base of calyx teeth, ovate or narrowly ovate, narrowed gradually to a subulate, shortly setose apex 6—9 mm.; inner ones 1/2—3/4 as long as calyx, broadly ovate, abruptly attenuate to an aristate or subulate apex 3—4 mm, margins broadly membranaceous; Calyx 14—17×4—5 mm, cylindrical, green or purplish. Teeth 4—6 mm, broadly triangular, acuminate, margin shortly ciliate. Petal limb obovate, 7—10×5—7 mm, deep pink or purple with dark dots above, greenish-yellow beneath, barbulate, dentate; claws slightly exserted (fig. 2—3, page 43).

Habitat: Subalpine meadows, 1750—2100 m a. s. l.

Fl. VII. Fr. VIII.

Distribution: Edemic of SW Transcaucasia (Georgia: Java-kheti floristic region, Armenia: Upper Akhuryan floristic region).

Taxonomic relationships: Related to *D. caucaseus* Sims, differing by almost linear, long tapered towards apex leaves as well as by not leaf-like outer epicalyx scales and shorter calyces.

This species is described in honour of a famous researcher of the Armenian flora Prof. E. Ts. Gabrielyan.

**7. *D. grossheimii*** Schischk. 1936, Тр. Бот. инст. АН СССР, 1, 3: 186; Schischk. 1936, Фл. СССР 6: 838; Grossh. 1945, Фл. Кавк. ed. 2, 3: 288; id., 1949, Опред. раст. Кавк.: 559; Schischk., Avet. 1956, Фл. Арм. 2: 201; M. Kuzmina, 2002, Komarovia, 2: 40.

Stony and grassy slopes, mountain steppe, 1900—2300 m a. s. l. Fl. VI. Fr. VII. — Armenia: Sevan. (Janykh), Shir. (Jajur pass), Dar.

The Caucasus (S Transcauc.: Armenia). Endemic of Armenia.

Described from Armenia (Vayots Dzor region): "Armenia, Daralagöz, prope pag. Alaczep [Ag-kend]. Fl. 8 IX 1931, leg. I. Kariagin et B. Safiev". The location of the type material is unknown. According to M. Kuzmina (2003), type material is not in BAK. I didn't find any type material in LE. Grossheim (1945) revealed that the village name Alaczep in the protologue is identical to that of village Ag-Kend [Aghnjadzor]. A specimen collected from locus classicus and determined by B. Schischkin is in ERE: "Азизбековский район, Агкенд. Заросли куст. 20.08.1947, leg. П. Ярошенко, det. B. Schischkin, ERE 58918!".

**8. *D. transcaucasicus*** Schischk. 1929, Изв. Томск. гос. ун-та, 80: 452; Grossh. 1930, Фл. Кавк. 2: 433; Schischk. 1936, Фл. СССР, 6: 819; Grossh. 1945, Фл. Differs from the closely related *D. asperulus* Boiss. et Huet, which has ovate mucronate dents of calyx, by lanceolate calyx dents sometimes alternated with more or less broad-membranaceous ones. I have investigated the type material of *D. asperulus* (holo.: "In via Persiae 2 h. Erzeroum, a Jul. 1853, A Huet du Pavillon", G-BOIS) as well as several specimens from E Turkey ("fentes des rochers pres Baibout, 11. Juillet 1862, no. 55, E. Bourgeau, G-BOIS", "Taurus Cataonicus, Beg dagh, 1865, Ch. Haussknecht", G-BOIS, "Locis subaridis dispersus ad pagum Goschkar alt. 5600', No. 384, 22. 8. 1859, Th. Kotschy", G-BOIS, LE). Nevertheless, it is necessary to investigate the additional material from E Anatolia for a more precise definition of relationships between these two taxa having rather overlapping areas of distribution.

H. Reeve (1967), M. Kuzmina (2002) place *D. transcaucasicus* and *D. asperulus* into synonyms of *D. masmenaeus* Boiss. (holo.: "region sous-alpine du Masmeneu-Dagh a 29 lieues au SSO de Cesarée, no. 864, 7 Septembre 1855, B. Balansa", G-BOIS!, iso. G!). According to the data obtained, *D. asperulus* and *D. transcaucasicus*, which occur in NE Anatolia, are characterized by flowers in a compact head at the top of the stem. Whereas *D. masmenaeus* distributed in the central and western parts of E. Turkey (vilayets Nigde, Seyhan, Marash, Kayseri, Maltya, Tunceli), has groups of 1—3 flowers scattered on a very branched stem.

**Holotypus:** Армения, Мегринский р-н, окр. с. Карчеван, над медно-молибденовым карьером возле бывшего с. Агарак (Егерак) 1250—1300 м над ур. м., N 38° 54'.8" / E 46° 11', 11.06.2007, M. Агабабян, A. Нерсесян, И. Габриелян, ERE 174587 (fig. 4).

Habitatio: In clivis aridis, 1200—1300 m supra maris aequor.

Distributio: In Armeniae regione floristica Meghri endemica.

Affinitas: A simili nimis polymorpho *D. cretaceo* Adams foliis basalibus rigidis spinescentibus divaricatis et limbo petalarum late obovato, obtuse dentato differt.

Speciem nostram botanicorum celeberrimum A. L. Takhtajan commemorat.

Tufted perennial. Flowering shoots 10—14 cm tall, single-flowered, unbranched. Leaves very narrowly linear-lanceolate, stiff, straight, flat or conduplicate, margins shortly stiff-ciliate, sheaths whitish. Leaves of sterile shoots divaricate, 15—22×0.5—1 mm, almost subulate, spinescent, with inconspicuous veins. Cauline leaves 15—25×0.6—1 mm, appressed to the stem, acuminate, with 3 prominent veins, sheaths 2—3 mm long. Epicalyx scales 4—6, 1/3 as long as calyx, broadly ovate, abruptly attenuate into subulate apices 1—3 mm, margins broadly membranaceous. Calyx 15—17×4 mm, cylindrical, light purple at its base and at the base of the teeth, greenish in the middle. Teeth 5—6 mm, narrowly triangular, acute, margin shortly ciliate. Petals white; petal limb 6—7×5—6 mm, broadly obovate, ebarbulate, distinctly obtuse-dentate; claw slightly exserted from the calyx.

Habitat: Dry slopes, 1200—1300 m a.s.l.

Fl. VI. Fr. VII.

Distribution: Endemic of Armenia (Meghri floristic region).

Taxonomic relationships: Closely related to the very polymorphic *D. cretaceus* Adams, distinguishing by stiff, spinescent divaricate basal leaves and broadly obovate, obtusely dentate petal limb.

This species is dedicated to the memory of the prominent botanist A. L. Takhtajan.

13. ***D. inamoenus*** Schischk. 1936, Фл. СССР, 6: 897, ib.: 842; Grossh. 1945, Фл. Кавк. ed. 2, 3: 289; id., 1949, Опред. раст. Кавк.: 558; Karjagin, 1952, Фл. Азерб. 3: 378; Schischk., Avet. 1956, Фл. Арм. 2: 201; Gvinian. 1978, Фл. Груз. 4: 193. — *D. lenkoranicus* Kharadze, 1951, Not. Syst. Georg. (Tbilis.) 16: 46.

Described from Georgia. Holo.: “Тифлис. По р. Вере, каменистые склоны. 26.V. 1917. Б. Шишкин” ?LE, iso. TBI!. I didn't find the holotype in LE collections,

Limestone stony slopes, 500—700 m a. s. l. Fl. VII. Fr. VIII. — Armenia: Ijev. (Bagratashen), Meghri. (Shvanidzor).

The Caucasus (?the eastern part of the Great Caucasus, C, E, S Transcauc., Talysh), ?E Anatolia, NW Iran.

Type material of *D. lenkoranicus* (syntypi: “Талыш. Лес на rope Нудус-галиси (7000’), 17.VI.1894. А. Ломакин”, TBI!; “Prov. Baku, distr. Lenkoran, Lerik. In silva. 20.VII.1917. A. Grossheim”, TBI!) differs from *D. inamoenus* only by size of calyces, but not by calyx shape. Calyx colour and shape of calyx dents proved to be not stable. That is why *D. lenkoranicus* is treated as a synonym of *D. inamoenus*.

14. ***D. anatolicus*** Boiss. 1842, Diagn. Pl. Or. Sér. 1, 1: 22. — *D. parviflorus* Boiss. 1842, Diagn. Pl. Or. Sér. 1, 1: 21; Schischk., E. Avet. 1956, Фл. Арм. 2: 202. — *D. anatolicus* var. *parviflorus* Boiss. 1867, Fl. Or. 1: 490.

Stony and grassy slopes, 1900—2000 m a. s. l. Fl. VII. Fr. VIII. — Armenia: Dar. (v. Khachik, v. Gnishik).

The Caucasus (S Transcauc.: Armenia), Anatolia.

Described from Turkey. ***Lectotypus (hic designatus)*:** “Sypili dumosis supra Magnesia[m], Jul.1842” [E. Boissier], G-BOIS!

15. ***D. floribundus*** Boiss. 1860, in Tchich., Asie Min. Descr. Bot. 1: 221; Grossh. 1930, Фл. Кавк. 2: 429; Schischk. 1936, Фл. СССР, 6: 845; Grossh. 1945, Фл. Кавк. ed. 2, 3: 289; Karjagin, 1952, Фл. Азерб. 3: 378; Schischk., E. Avet. 1956, Фл. Арм. 2: 209; Gvinian. 1978, Фл. Груз. 4: 194 — *D. tabriscianus* Bien. ex Boiss. 1867, Fl. Or. 1: 496; Grossh. 1930, Фл. Кавк. 2: 428; Schischk. 1936, Фл. СССР, 6: 855; Grossh. 1945, Фл. Кавк. ed. 2, 3: 294; id., 1949, Опред. раст. Кавк.: 560; Karjagin, 1952, Фл. Азерб. 3: 385. — *D. schischkinii* Grossh. 1949, Бот. Мат. (Ленинград), 11: 83; id., 1949, Опред. раст. Кавк.: 561. — *D. woronowii* Schischk. in sched.

Dry, stony slopes, 1000—1500 m a. s. l. Fl. VI. Fr. VII. — Armenia: Shir., Apar., Sevan., Erev., Dar.; Nakhichevan.

The Caucasus (W, SW and S Transcauc.), NE Anatolia, W Iran.

Described from NE Anatolia: “Armenia inter origines fl. Araxis, huc Eritchan [Erichtak] dicti, ad pedem septentrionalis jugi Mille Lacuum (Bingoel-dagh) alt. c. 2000 m, T.; Tchihat. pl. As. Min. exsicc. An. 1858, N 866].” Holo.: “Asia minor. OEst. 1858. M. de Tchihatchef. Armenia ad radices boriales Bingöl dagh”, G-BOIS!, iso. K.

*D. schischkinii* (holo.: “Azkur. No. 313. [06.] Jun. [18]75. G. Radde”, LE!, iso. LE!), *D. tabriscianus* [lecto. (K. H. Rechinger, 1988, Fl. Iran, 163: 146): “Nehmetabad prope Tabris. Jun. 1859”, G-BOIS!, isolecto. LE!) and *D. woronowii* (in sched.: “Батумская обл. Окр. г. Артвина, с. Ломашены, г. Махлюзе, 9. VI. 1909, П.В. Несторов”, LE!) are removed into the synonyms of *D. floribundus*, because the shape of epicalyx scales as well as the degree of the petal limb dissection of these taxa are not constant and cannot serve as diagnostic features.

16. ***D. canescens*** K. Koch, 1841, Linnaea, 15: 710; Grossh. 1930, Фл. Кавк. 2: 432; Schischk. 1936, Фл. СССР, 6: 854; Фл. Кавк. ed. 2, 3: 294; id., 1949, Опред. раст. Кавк.: 560; Schischk., E. Avet. 1956, Фл. Арм. 2: 209. — *D. fimbriatus* M. Bieb. *canescens* (K. Koch) Boiss. 1867, Fl. Or. 1: 496; — *D. orientalis* auct. non Adams: Reeve 1967, Fl. Turk. 2: 120, p.p.; M. Assadi 1985, Iran. Journ. Bot. 3, 1: 34, p. p.

Stony slopes, 800—1000 m a. s. l. Fl. VI. Fr. VII. — Armenia: Erev.

The Caucasus (S. Transcauc: Armenia), NE Anatolia.

Described from Armenia: “In deserto petroso prope clastrum Etschmiadsin frequenter”. Type material is lost.

The species was included into *D. orientalis* by E. Boissier (1867). The same opinion express H. Reeve (1967) and M. Assadi (1985). Nevertheless, thick petals and thin epicalyx scales obviously indicate close relationships with *D. floribundus*, but not with *D. orientalis*.

Sect. 5. ***Fimbriati*** (Boiss.) F. Williams

17. ***D. libanotis*** Labill. 1791, Ic. Pl. Syr. Dec. [Rar.], 1: 14, tab.4; Grossh. 1930, Фл. Кавк. 2: 428; Schischk. 1936, Фл. СССР, 6: 848; Grossh. 1945, Фл. Кавк. ed. 2, 3: 292; id., 1949, Опред. раст. Кавк.: 560; Karjagin, 1952, Фл. Азерб. 3: 381; Schischk., E. Avet. 1956, Фл. Арм. 2: 202.

Dry slopes, 800—1300 m.. Fl. VIII. Fr. IX. — Armenia: Erev., Dar.; Nakhichevan.

The Caucasus [S Transcauc.], W Asia.

Described from Lebanon: “in altis montibus Libani [J. J. H. de Labillardiere]”. Holo.: «Orient. Labill.», G-DC!

18. ***D. crinitus*** Sm. 1794, Trans. Linn. Soc. London (Bot.), 2, 1: 300; Grossh. 1930, Фл. Кавк. 2: 428; Schischk. 1936, Фл. СССР, 6: 850; Grossh. 1945, Фл. Кавк. ed. 2, 3: 292; id., 1949, Опред. раст. Кавк.: 560; Karjagin, 1952, Фл. Азерб. 3: 381; Schischk., E. Avet. 1956, Фл. Арм. 2: 202; Gvinian. 1978, Фл. Груз. 4: 197.

Dry, stony slopes, mountain steppes, 1000—2000 (3000) m a. s. l. Fl. VI—VII. Fr. VIII. — Armenia: all regions, except of U. Akhur. and Gegh.; Nakhichevan.

The Caucasus (?the eastern part of the Great Caucasus, W, C, E, SW and S Transcauc., Talysh), Anatolia, N and W Iran, ?Middle Asia.

Described from Armenia: «in Armeriâ. Variat flore albo. Tournefort». Location of the type material is unknown.

Very polymorphic species varying in the height and branching degree of the stem, in the number and shape of epicalyx scales, in the petal colour and the shape of petal limb.

19. ***D. crossopetalus*** (Fenzl ex Boiss.) Grossh. 1930, Фл. Кавк. 2: 428; Grossh. 1930, Фл. Кавк. 2: 428; Schischk.

1936, Фл. СССР, 6: 850; Grossh. 1945, Фл. Кавк. ed. 2, 3: 292; id., 1949, Опред. раст. Кавк.: 560; Karjagin, 1952, Фл. Азерб. 3: 381; Schischk., E. Avet. 1956, Фл. Арм. 2: 209. — *D. crinitus* Sm. . *crossopetalus* Fenzl ex Boiss. 1867, Fl. Or. 1: 496.

Rocks, screes, 800—1600 m a. s. l. Fl. VI. Fr. VII. — Nakhichevan. Could be found in the South of Armenia.

The Caucasus (S Transcauc.: Nakhichevan, Talysh), Anatolia, N and W Iran.

Described from Iran. Lecto. (Rechinger, 1988, Fl. Ir. 163: 179): «In l. arenosis et lapidosis prope urban Teheran, no. 21, 15.Apr.1843, Th. Kotschy. Pl. Pers. bor. Ed. R. F. Hohenacher. 1846.», W, isolecto. G-BOIS!

The species differs from the closely related polymorphic *D. crinitus* by the combination of short stem (5—20 cm) with a very long calyx (30—45 mm) and with long herbaceous apices of epicalyx scales.

20. ***D. orientalis*** Adams, 1805, in B. Weber et Mohr, Beitr. Naturk. 1: 54; Grossh. 1930, Фл. Кавк. 2: 427; Schischk. 1936, Фл. СССР, 6: 854; Grossh. 1945, Фл. Кавк. ed. 2, 3: 295; id., 1949, Опред. раст. Кавк.: 560; Karjagin, 1952, Фл. Азерб. 3: 382; Schischk., E. Avet. 1956, Фл. Арм. 2: 209; Gvinian. 1978, Фл. Груз. 4: 198. — *D. fimbriatus* M. Bieb. 1808, Fl. Taur.-Cauc. 1: 332.

Described from Georgia. Holo.: “habitat circa Tiflis, Adams”, LE!

#### a. subsp. ***orientalis***.

Rocks, 1000—3100 m a. s. l. Fl. VI—VII. Fr. VIII—IX. — Armenia: U. Akhur., Lori., Ijev., Shir., Apar., Arag., Sevan., Gegh. (Geghard), Erev., Dar., Zang., Meghri.; Nakhichevan.

The Caucasus (the eastern part of the Great Caucasus, Transcauc., Talysh), Anatolia, Iraq, Iran.

b. subsp. ***aphanoneurus*** Rech. f. 1986, Pl. Syst. Evol. 151: 290. — *D. aphanoneurus* (Rech. f.) M. Kuzmina, 1996, Бот. журн. 81, 8: 82.

Rocks, 1200—1900 m a. s. l. Fl. VII. Fr. VIII. — Armenia: Dar., Zang., Meghri.; Nakhichevan.

The Caucasus (S Transcauc.), W and S Iran.

Described from Western Iran. Holo.: “Plesia occidentalis: Prov.: M. Sawers, Luristan, 9000', Juli 1868, C. Haussknecht” W, digital image!, sp. auth. G-BOIS!, G!

Armenian specimens differ from type specimens by ebarbulate petal limb.

Intermediates between *D. orientalis* subsp. *orientalis* and *D. orientalis* subsp. *aphanoneurus* occur in Darelegis floristic region of Armenia.

c. subsp. ***nassreddinii*** (Stapf) Rech. f. 1986, Pl. Syst. Evol. 151: 292. — *D. nassreddinii* Stapf. 1886, Denkschr. Akad. Wiss. Math.-Naturw. (Wien), 51: 279. — *D. fimbriatus* M. Bieb. var. *brachyodontus* Boiss. et Huet 1856 in Boiss., Diagn. Pl. Or. Nov. 2, 5: 53, p. p. — *D. dumulosus* Boiss. et Huet, 1853, in Pl. Arm. Exs., in sched.; Grossh. 1930, Фл. Кавк. 2: 427. — *D. brachyodontus* Grossh. 1945, Фл. Кавк. ed 2, 3: 294; id. 1949, Опред. раст. Кавк.: 560; Karjagin, 1952, Фл. Азерб. 3: 382.

Rocks, 1300—2100 m a. s. l. Fl. VI—VII. Fr. VIII—IX. — Armenia: expected to be found. Nakhichevan: expected to be found.

Caucasus (Talysh), NE Anatolia, N Iraq, W Iran.

Described from Western Iran. Holo.: «In monte Elwend (Media). 1882. Legit Th. Pichler», WU, digital image!, iso. K!, WU, digital images, 2 ex.!

Two specimens, cited by M. Kuzmina (1996) as *D. nassreddinii* (“Хах. АССР, юго-зап. склон Зангезурского хребта, Капуджух, 27.08.1952, А. Федоров”, LE!, “Inter Ordubad et p. Meghri, in fauc. Fl. Arax. 25.06.1929, A.

Schelkovnikov et E. Kara-Murza”, ERE!, LE!) seem to be hybrids between *D. cretaceus* and *D. crinitus*, because the petals are white and completely ebarbulate, whereas *D. orientalis* subsp. *nassreddinii* has pink and barbulate petals).

d. subsp. ***obtusisquamatus*** (Boiss.) Rech. f. 1986, Pl. Syst. Evol. 151: 291. — *D. fimbriatus* M. Bieb. . *obtusisquamatus* Boiss. 1867, Fl.Or. 1: 495.

Rocks, 1400—1800 m a. s. l. Fl. VI. Fr. VI. — Armenia: Dar. The Caucasus (S Transcauc.: Armenia), W and C Iran.

Described from Iran. Lecto. (K. H. Rechinger, 1988, Fl. Ir.: 162): “In valle Talagon m. Elbrus, 515, 14.07.1843. leg. Kotschy”, G-BOIS!

21. ***D. martuniensis*** M. Kuzmina, 1996, Бот. журн. 81, 8: 81

Rocks, stony slopes, 2200—2300 m a. s. l. Fl. VII—VIII. Fr. VIII—IX. — Armenia: Sevan., Dar.; Nakhichevan (v. Kjukju).

The Caucasus (S Transcauc.), NE Anatolia.

Described from Armenia. Holo.: “Армянская ССР, Мартунинский р-н, Селимский перевал, 18.VIII.1954, С. Г. Тамамшян, Г. А. Денисова”, LE!

The species is morphologically close to *D. orientalis* subsp. *macropetalus* (Boiss.) Rech. f. which is distributed in Iraq and W Iran (syntypi: “in rup. M. Schahu, 8000', [no.] 187, Jul. 1867. Haussknecht”, G-BOIS!, “In rup. calc. m. Avroman, 7000' no. 188, Jul. 1867, Haussknecht”, G-BOIS!). *D. martuniensis* differs by branched in the upper part stems, reddish, fusiform-narrowed towards apex and smaller calyces (18—20×2—3 mm) as well as by densely barbulate petal limbs.

Intermediates between *D. martuniensis* and *D. orientalis* with long epicalyx scale apices and wide leaves in combination with ebarbulate petal limb, short leaf sheaths of stem leaves and numerous shortened sterile shoots at the base of stems occur in Sevan and Darelegis floristic regions of Armenia.

22. ***D. jacobsii*** Rech. f. 1983, Pl. Syst. Evol. 142: 243

Rocks, stony slopes. 1200—1800 m. Fl. VI. Fr. VII — Nakhichevan (Komadara). Armenia: expected to be found.

The Caucasus (S Transcauc.), NE Anatolia, Iran.

Described from Iran. Holo.: «Persia: W: Prov. Kurdistan, Sanangaj. Low rolling mountains of dark slaty rock with open herbaceous vegetation, 35°03'N, 46°57'E, 1200—1400 m s. m., 21.VI.1963. Jacobs 6979”, W, digital image!, iso. E.

Specimens of *D. crinitus* with 6—8 epicalyx scales and large calyces occur in Lori, Darelegis and Zangezur floristic regions of Armenia (“Спитак, 18.07.1938, А. Тахтаджян”, ERE 29234!, “Арм. ССР, между Селимским перевалом и с. Ахкенд, левый борт, грунт нагорных ксерофитов, западный каменистый склон, 2200 м, 30.08.1956, Я. Мулкиджян, Р. Карапетян”, ERE 73094!, “Зангезур, Сисианский р-н, окр. с. Шамб, левый борт ущелья р. Воротан, 1350 м над ур. м., на диатомитовых отложениях, 12.10.1983, В. Манакян”, ERE 122502!, “Горисский р-н. Окр. с. Хнацах, на границе с Азерб. ССР, 30.08.1972, Н. Ханджян, К. Таманян, ERE 104095!”). The specimens are close to *D. jacobsii*, differing, nevertheless, by deeply fimbriate petal limb.

Sect. 6. ***Verruculosi*** (Boiss.) Nersesian, stat. nov. — § 1. *Verruculosi* 1867, Fl. Or. 1: 479. 482, stat. indefin.

23. ***D. cyri*** Fisch. & C. A. Mey. 1837, Index Sem. Hort. Bot. Petropol. 4: 34; Grossh. 1930, Фл. Кавк. 2: 427; Schischk. 1936, Фл. СССР, 6: 860; Grossh. 1945, Фл. Кавк. ed. 2, 3: 295; id. 1949, Опред. раст. Кавк.: 558; Karjagin, 1952, Фл. Азерб. 3: 385; Schischk., E. Avet. 1956, Фл. Арм. 2: 210; Gvinian. 1978, Фл. Груз. 4: 201; Dmitrieva, 1990, Опред. раст. Аджар. 2: 106.

Dry slopes, riverside sands, 800—1100 m a. s. l. Fl. V—VI. Fr. VII. — Armenia: Erev., Dar.; Nakhichevan.

The Caucasus (Transcauc., Talysh), W Asia.  
Described from the Transcaucasia. Holo.: "In desertis ad fl. Kur. In prov. Elisabethpol, Jul. Hohenack." LE!

**D. barbatus** L., **D. caryophyllus** L. and **D. plumarius** L. are cultivated in the region and sometimes are naturalized.

**Determination key to *Dianthus* species  
in Southern Transcaucasia**

1. Flowers in heads at the top of stems. Petal limb purple, with dark dots, barbulate . . . . . 2
- Flowers not in heads . . . . . 5
2. Annual or biennial. Calyx pubescent, 17–20 mm long. Stem 10–45 cm . . . . . 1. **D. armeria** L.
- Perennials. Calyx glabrous, rarely puberulent . . . . . 3
3. Sheaths of stem leaves 3–4 mm long. Stems 20–35 cm . . . . . 8. **D. transcaucasicus** Schischk.
- Sheaths of stem leaves 8–20 mm long. Stems 40–70 cm . . . . . 4
4. Bracts 1.5–2 times wider than the epicalyx scales, enveloping the inflorescence, stiff and coriaceous. Sheaths of the upper stem leaves inflated . . . . . 3. **D. subulosus** Freyn & Conrath
- Bracts almost equal to the epicalyx scales, not enveloping the inflorescence, thin, scarious. Sheaths of the upper stem leaves not inflated . . . . . 2. **D. calocephalus** Boiss.
5. Annuals. Calyx verruculose. Petals pink, dentate, ebarbulate. Stems 15–30 cm . . . . . 23. **D. cyri** Fisch. & C. A. Mey.
- Perennials. Calyx glabrous . . . . . 6
6. Petal limb entire, dentate, or deeply dentate; if nearly to 1/3 dissected into broad lobes, then thick . . . . . 7
- Petal limb thin, to 1/4 and deeper fimbriate, sometimes shortly fimbriate . . . . . 18
7. Petal limb barbulate, pink, reddish or purple, with darker spots, yellowish-green beneath . . . . . 8
- Petal limb ebarbulate, white, yellowish-white, rarely pinkish, without darker spots, of the same colour from both sides or olive-greenish beneath . . . . . 12
8. Epicalyx scales 0–2(4). Caespitose plants 5–15 cm tall . . . . . 4. **D. raddeanus** Viehr.
- Epicalyx scales 4–6(8). Plants taller . . . . . 9
9. Calyx 3–4 mm wide, narrowly cylindrical . . . . . 10
- Calyx 4–7 mm wide, cylindrical . . . . . 11
10. Flowering stems loosely branched from the base or in the upper half. Leaves almost linear. Flowers solitary. Apices of all the epicalyx scales aristate. Stems 15–30 cm . . . . . 9. **D. aristatus** Boiss.
- Flowering stems compactly branched in the upper 1/4. Leaves lanceolate. Flowers usually approximate. Apices of the outer epicalyx scales flat, green. Stems 20–40 cm . . . . . 7. **D. grossheimii** Schischk.
11. Leaves from narrowly lanceolate to lanceolate, gradually acuminate, 3–5 mm wide. Outer epicalyx scales leaf-like. Calyx 15–22×4–6 mm. Stems 20–40 cm . . . . . 5. **D. caucaseus** Sims
- Leaves narrowly lanceolate-linear, almost linear, long tapered towards apex, 1.5–2 (2.5) mm wide. Outer epicalyx scales not leaf-like. Calyx 14–17×4–5 mm. Stems 20–25(30) cm . . . . . 6. **D. gabrieliana** Nersesian
12. Epicalyx scales patent, mucronate, up to 1/3 of calyx length. Petals whitish or yellowish-green, crenate to dentate. Stem 20–45 cm . . . . . 13. **D. inamoenus** Schishk.
- Epicalyx scales adpressed to calyx . . . . . 13
13. Petals thick, yellowish-white or pinkish above, olive-greenish beneath . . . . . 14
- Petals thin, white, rarely pinkish, of the same colour above and beneath . . . . . 16
14. Calyx 5–11 mm, contracted under the teeth. Petal limb finely dentate. Stem 10–20 cm . . . . . 14. **D. anatolicus** Boiss.
- Calyx larger, cylindrical. Petal limb deeply dentate or up to 1/3 dissected into broad lobes . . . . . 15
15. Calyx 15–20 mm. Petal limb cuneate, gradually narrowed into claw; white or pinkish above. Stems 15–20 cm, glabrous above, rarely very shortly puberulous . . . . . 15. **D. floribundus** Boiss.
- Calyx 22–30 mm. Petal limb broadly cuneate, abruptly narrowed into claw; whitish above. Stems 20–25 cm, densely puberulous at the base . . . . . 16. **D. canescens** K. Koch
16. Immature capsules with well expressed roll beneath teeth. Outer epicalyx scales with herbaceous apices, often reaching calyx teeth or even longer. Calyx 25–30 mm, long tapered towards apex. Stems 20–40 cm . . . . . 11. **D. zangezuricus** Nersesian
- Immature capsules without well expressed roll. Epicalyx scales with subulate or herbaceous apices, usually not exceeding calyx length. Calyx not long tapered . . . . . 17
17. Basal leaves stiff, almost subulate, spinescent, divaricate. Petal limb broadly obovate, obtuse-dentate, whitish. Stems 10–14 cm . . . . . 12. **D. takhtajanii** Nersesian
- Basal leaves not stiff, not spinescent, not divaricate. Petal limb white, rarely pinkish, broadly cuneate, entire, crenate, rarely acute-dentate . . . . . 10. **D. cretaceus** Adams
  - i. Calyx 10–20 mm, abruptly contracted beneath of divaricate teeth, usually dark-reddish. Outer epicalyx scales herbaceous. Petals 1/5–1/4 longer than calyx 10. c. subsp. **dmanissianus** Boiss. & Huet) Nersesian
  - ii. Immature capsules with slightly expressed roll beneath teeth or without it. Epicalyx scales 4–6, tapered into rigid apex . . . . . 10. d. subsp. **sevanensis** Nersesian
  - iii. Densely caespitose plants. Stems 10–15(20) cm. Calyces reddish. Occurs at an altitude of 2300–3900 m. . . . .
  10. b. subsp. **multicaulis** (Boiss. & Huet) Nersesian
- Loosely caespitose plants. Stems (15)20–40 cm. Calyces greenish, rarely reddish. Occur at an altitude of 1500–2500 (2800) m . . . . . 10. a. subsp. **cretaceus**
18. Calyx 30–40 mm. Leaves rigid, spinose. Outer epicalyx scales cuspidate, patent. Stems robust, 25–60 cm. Petal limb white with reddish spots, up to 1/2 fimbriate. Flower with a strong odour . . . . . 17. **D. libanotis** Labill.
- Calyx shorter. Leaves herbaceous. Epicalyx scales adpressed to calyx. Plants not robust . . . . . 19
19. Petals limb more than to 1/2 fimbriate . . . . . 20
- Petal limb up to 1/3 fimbriate . . . . . 21
20. Calyx 25–30(35) mm. Stems 15–40 cm, with numerous nodes. Epicalyx scales 4–6(8), without long herbaceous apices . . . . . 18. **D. crinitus** Sm.
- Calyx 30–35(45) mm. Stems 5–15 (20) cm, with 2–5 nodes. Epicalyx scales 4(6), outer ones with long herbaceous apex . . . . . 19. **D. crossopetalus** (Fenzl ex Boiss.) Grossh.
21. Calyx 30–35 mm. Petals pale-pink. Epicalyx scales 6–8 (10), oblong or roundish, with long thin apex or mucronate . . . . . 22. **D. jacobsii** Rech.f.

- Calyx shorter, 15—27 mm. Petals pink . . . . . 22.
22. Epicalyx scales 6—8, abruptly tapered into acicular apex 1.5—2 mm. Shortened sterile shoots absent. Petals densely barbulate. Stems 20—40 cm . . . . . 21. **D. martuniensis** M. Kuzmina
- Epicalyx scales 4—14, without acicular apices. Shortened sterile shoots present. Petals ebarbulate or rarely barbulate. Stems 10—30 cm . . . . . 20. **D. orientalis** Adams i. Epicalyx scales (4)6—8(14), imbricate. . . . . ii
- Epicalyx scales 4(6), not imbricate . . . . . iii
- ii. Epicalyx scales (4) 6—8 (10), acuminate or gradually tapered into short apex. Stems not virgate. . . . . 20a. subsp. **orientalis**
- Epicalyx scales 8—12 (14), shortly mucronate. Stems virgate . . . . . 20b. subsp. **aphanoneurus** Rech. f. iii. Epicalyx scales roundish or emarginated at the apex, acuminate. Calyx 15—20 mm. Petal limb oblong-cuneate, ebarbulate . . . . . 20d. subsp. **obtusisquamatus** (Boiss.) Rech. f.
- Epicalyx scales abruptly mucronate. Calyx 20—25 mm. Petal limb obovate, barbulate . . . . . 20c. subsp. **nassreddinii** Stapf

### Acknowledgements

I would like to express my deepest gratitude to the Curators and Directors of the herbaria G, K, LE, TBI, TGM for their valuable advices and kind assistance. My special thanks to Prof. Werner Greuter for the correction of the Latin diagnoses.

### OGANESIAN M. E.

### GENUS ACANTHOLIMON BOISS. (PLUMBAGINACEAE) IN SOUTH TRANSCAUCASIA (ARMENIA, NAKHICHEVAN)

Instead of 19 species cited for South Transcaucasia (Мирзоева, 1956, 1981; Тамамшян, 1967) we count 15. Two species have been described new to science, *A. manakyani* and *A. takhtajanii*, the latter was previously wrongly identified by Caucasian authors as *A. armenum* Boiss. or *A. balansae* (Boiss. & Huet) Bunge. Two species (*A. festucaceum* (Jaub. & Spach) Boiss. and *A. tenuiflorum* Boiss.) are new for the flora of Armenia and South Transcaucasia. Nine species (*A. avenaceum* Bunge, *A. calvertii* Boiss., *A. lepturoides* (Jaub. & Spach) Boiss., *A. acerosum* (Willd.) Boiss., *A. puberulum* Boiss. & Balansa, *A. echinus* (L.) Boiss., *A. armenum* Boiss., *A. scorpius* (Jaub. & Spach) Boiss. have been excluded from the floras of the Caucasus or South Transcaucasia. The species cited as *A. scorpius* (Гроссгейм, 1939) and not mentioned afterwards by С. Г. Тамамшян (1967) is identified as *A. tragacanthinum* (Jaub. & Spach) Boiss. The lectotype of *A. vedicum* Mirzoeva has been designated. A checklist of the genus in South Transcaucasia and a key to the species are enclosed.

*Acantholimon*, taxonomy, new species, South Transcaucasia

**Նոյնանմխայն Մ. Է. *Acantholimon* Boiss. Ենթը Հարավային Անդրկովկասմ (Կասպական, Նախիջեան):** Հարավային Անդրկովկասի համար նշված 19 տեսակի փոխարքն (Мирзоева, 1956, 1981; Тамамшян, 1967) մենք ընդունում ենք 15-ը: Նկարագրվում է զիտուրյան համար 2 նոր տեսակ՝ *A. manakyani* և *A. takhtajanii*: Վերջինս Կովկասի բոլոր բուսաբանների կողմանց որոշվել է ոչ ճիշդ՝ որպես *A. armenum* Boiss. Կամ *A. balansae* (Boiss. & Huet) Bunge. Կասպականի և Հարավային Անդրկովկասի ֆլորաների համար թրվին են 2 նոր տեսակ (*A. festucaceum* (Jaub. & Spach) Boiss. և *A. tenuiflorum* Boiss.): 9 տեսակ (*A. avenaceum* Bunge, *A. calvertii* Boiss., *A. lepturoides* (Jaub. & Spach) Boiss., *A. acerosum* (Willd.) Boiss., *A. puberulum* Boiss. & Balansa, *A. echinus* (L.) Boiss., *A. quinquelobum* Bunge, *A. armenum* Boiss., *A. scorpius* (Jaub. & Spach) Boiss.) հանդում են Հայաստանի և Հարավային Անդրկովկասի ֆլորաների կազմից: Տեսակ, թրված որպես *A. scorpius* (Гроссгейм, 1939) և չիշխափակած Թամամշյանի (Тамамшян, 1967) կողմից, մեր կողմից որոշված է որպես *A. tragacanthinum* (Jaub. & Spach) Boiss. *A. vedicum* Mirzoeva տեսակի համար առանձնացված է ինկուպուիս: Աշխաբանում թերվում են Հարավային Անդրկովկասում աճող տեսակների կոնսավելով և նրանց որոշման բանափառ:

*Acantholimon*, կարգաբանություն, նոր տեսակներ, Հարավային Անդրկովկաս

**Օգանեսյան Մ. Է. Род *Acantholimon* Boiss. в Южном Закавказье (Армения, Нахичеван).** Вместо приводимых для Южного Закавказья 19 видов (Мирзоева, 1956, 1981; Тамамшян, 1967) нами принимается 15. Описывается 2 новых для науки вида (*A. manakyani* и *A. takhtajanii*) — вид, ошибочно идентифицируемый всеми кавказскими авторами как *A. armenum* Boiss. или *A. balansae* (Boiss. & Huet) Bunge). 2 вида являются новыми для флор Армении и Южного Закавказья (*A. festucaceum* (Jaub. & Spach) Boiss. и *A. tenuiflorum* Boiss.). 9 видов (*A. avenaceum* Bunge, *A. calvertii* Boiss., *A. lepturoides* (Jaub. & Spach) Boiss., *A. acerosum* (Willd.) Boiss., *A. puberulum* Boiss. & Balansa, *A. echinus* (L.) Boiss., *A. quinquelobum* Bunge, *A. armenum* Boiss., *A. scorpius* (Jaub. & Spach) Boiss.) исключены из флоры Кавказа или Южного Закавказья. Вид, приводимый как *A. scorpius* (Гроссгейм, 1939), и затем не упоминаемый С. Г. Тамамшян (1967) определен нами как *A. tragacanthinum* (Jaub. & Spach) Boiss. Избран лектотип вида *A. vedicum* Mirzoeva. Приводится конспект рода в Южном Закавказье и ключ для определения видов.

*Acantholimon*, систематика, новые виды, Южное Закавказье

### Introduction

The first significant works on the group, limited to *Statice* L., Subgenus *Armeriastrum* Jaub. & Spach, belong to H. F. Jaubert & E. Spach (1842—1843, 1843). After the description of the genus *Acantholimon* (Boissier, 1846), the first monograph on the genus in whole belongs to A. Bunge (1872). The account of the genus in E. Boissier's "Flora Orientalis" (1875) was monographic in nature. S. Mobayen (1964) investigated the genus worldwide, but incompletely. In particular, he did not investigate the Caucasian material. All the other works on the genus in the Caucasus, Turkey and Iran are either accounts for the regional "Floras" or material for them (Кузнецова, 1902; Гроссгейм, 1932, 1939; Линчевский, 1952; Манденова, 1952; Мирзоева, 1955, 1956; Прилипко, 1957; Тамамшян, 1967; Мирзоева,
